

Hunting, butchering and aging Walrus: 5 tips to safely enjoy igunaq!

The walrus hunt is part of Inuit culture.

Ready, kids?

There are some important things you need to know to safely enjoy eating walrus.

Let's talk about that!

Inuit and scientists have worked together to give you their best tips.

Interviews were done with locals from four communities.

Us, the real experts!

Samples were collected by Inuit from across Nunavik through subsistence walrus hunts.

Our findings

Eating walrus has many health benefits!

- High levels of good fats

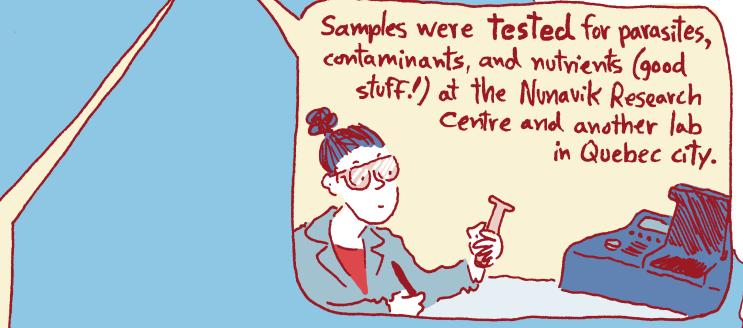

- Good levels of various nutrients

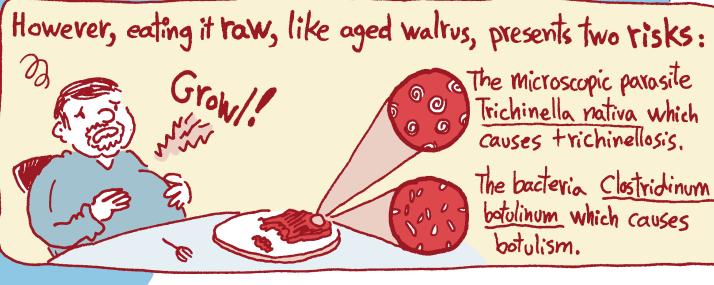

- Low level of mercury

Nothing to worry about!

Samples were tested for parasites, contaminants, and nutrients (good stuff!) at the Nunavik Research Centre and another lab in Quebec city.

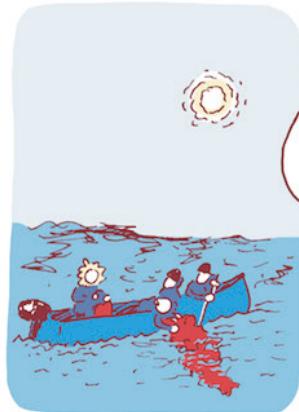

Inuit Knowledge on hunting, butchering, and preparing aged walrus is Key to a safe consumption.

Tip #1: Hunting

Don't hunt unhealthy, skinny or old walrus!

Tip # 2 : At the butchering site

This ice platform is clean, but if not use a clean tarp.

Don't forget to clean your tools back at home!

Be careful! Don't eat raw Walrus. It can be infected with a parasite, Trichinella.

Tip # 3 : Testing

Send a sample of the tongue to the Nunavik Research Centre.

Refrigerate the meat while waiting for the results.

It is very important to test the meat and wait for the results before eating it!

In the rare event that the meat is contaminated follow the public health recommendations. Don't forget: Aging the meat doesn't kill the parasite!

Once you get the results confirming that your meat is Trichinella free...

You're good to age your Walrus meat now!

Tip # 4 : Safely ageing the meat

Put the meat in a well ventilated container.

Loosely closed container

OR

Learn how to make a traditional seal bag

Put the meat in a cool place protected from the sun and ventilated

Traditionally buried under pebbles

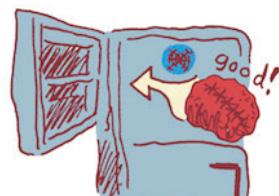

Or simply under your house

If you hunt in the summer, Public Health recommendations are to keep the raw meat in the freezer and age it when the temperature gets cooler.

Tip # 5 : Storage

Put your igunaq in the freezer once it is ready!

With the warming climate and more frequent mild spells, your igunaq may ferment too much or go bad, so you can't eat it anymore.

The most important thing is...

Enjoy this fabulous delicacy with your whole family and the community!
